

Activate your own eVault to secure eAssets[®] and streamline portfolio management

As the banking industry continues to embrace digitization to satisfy consumer demand and enhance efficiencies, the ability to securely store electronic assets (eAsset[®]) has become an essential component of the process. Although many financial institutions (FIs) rely on outsourced vaulting sources, implementing their own electronic vaults (eVault) can yield significant advantages and return on investment.

Storage within an internal eVault enables FIs to maintain control of their assets at all times while providing secure, streamlined multi-channel digital loan portfolio management. Taking eAssets from indirect finance businesses and bringing them into their own eVaults makes it easier, faster, and more secure for an organization to free up capital for syndication, sale, or securitization. Whether a financial institution wants to pledge to a trusted third party, or pool for sale or securitization into the secondary market with an immutable chain of custody, being able to access a single repository eliminates the hassles and challenges of a third party's controls and other outside vaulting sources, as FIs no longer have assets disbursed among multiple vaults they don't actually control.

Why implement your own eVault?

Establishing an internal eVault enables a financial institution to achieve numerous advantages, including:

Origination channel diversification

Simple, expedited batch transfers to counterparties

Simplified access to auditing and reporting of pledged collateral

Secure, encrypted, and tamper-proof asset storage and retention

Granular access controls for departmental separation and visibility

Regulatory and Federal Reserve Bank (FRB) requirements

Centralized data management across the entire asset portfolio

Accessibility and actionability when needed

Precision search on all assets and metadata

Access to the largest digital ecosystem enabling the ability to conduct business electronically with partners

Amalgamated assets that accelerate secondary market transactions and paths to liquidity

Complete control over all of your electronic assets

Our eOriginal[®] eVault is the trusted digital vault for the largest buyers and insurer of the asset-backed securities (ABS) of the US. The eOriginal eVault ensures digital loans remain negotiable and transferable by reliably establishing the person or entity to whom the single, authoritative copy of the digital loan is assigned, issued, or transferred.
